

Prefatory Note

The attached document represents the most complete and accurate version available based on original copies culled from the files of the FOMC Secretariat at the Board of Governors of the Federal Reserve System. This electronic document was created through a comprehensive digitization process which included identifying the best-preserved paper copies, scanning those copies,¹ and then making the scanned versions text-searchable.² Though a stringent quality assurance process was employed, some imperfections may remain.

Please note that some material may have been redacted from this document if that material was received on a confidential basis. Redacted material is indicated by occasional gaps in the text or by gray boxes around non-text content. All redacted passages are exempt from disclosure under applicable provisions of the Freedom of Information Act.

¹ In some cases, original copies needed to be photocopied before being scanned into electronic format. All scanned images were deskewed (to remove the effects of printer- and scanner-introduced tilting) and lightly cleaned (to remove dark spots caused by staple holes, hole punches, and other blemishes caused after initial printing).

² A two-step process was used. An advanced optical character recognition computer program (OCR) first created electronic text from the document image. Where the OCR results were inconclusive, staff checked and corrected the text as necessary. Please note that the numbers and text in charts and tables were not reliably recognized by the OCR process and were not checked or corrected by staff.

MONEY MARKET AND RESERVE RELATIONSHIPS

Money markets

Recent developments. The spread between bill rates and other short-term rates widened during recent weeks. All short-term rates rose around the mid-March tax date, following the increase in the prime loan rate, but since then bill rates have fluctuated in a lower range while other short-term rates either have stabilized or have risen slightly further. The recent peak for the 3-month bill was reached in the mid-March auction at 4.72 per cent; subsequently, the 3-month bill rate declined sharply to as low as 4.46 per cent before moving back up above the discount rate.

Differences in supply situations help to account for the differential movements of bill and other short-term rates. Increased supplies of other short-term debt instruments -- notably, negotiable CD's and agency issues -- continued to reach the markets at rising yields necessitated by the conjunction of new financings and large roll-overs. On the other hand, the bill market was temporarily depleted of trading supply in the wake of unusually large purchases by investors during late winter; in addition, \$3 billion in March tax bills matured without replacement and the weekly \$100 million additions to the 3-month bill were drawing to a close. Most recently, dealers' inventories of bills have been rebuilt to sizable levels, in part through their own aggressive bidding in auctions, and this has led to the firming in bill yields.

1/ Base is average for month preceding specified period or in the case of weekly periods, the week preceding.

2/ Time deposits, adjusted, at all commercial banks differs from time deposit required reserve series in Table A-2 since latter includes only member banks.

p - Preliminary.

April 8, 1966.

Over the three statement weeks ending April 6, net borrowed reserves averaged about \$230 million and member bank borrowings about \$580 million -- in each case slightly higher than the levels of the previous 3-week period. The Federal funds market also appeared to tighten a shade further, with funds trading at an effective rate of 4-3/4 per cent on 10 of the 15 days in the period and with a small amount of trading at a new high 4-7/8 per cent rate reported late in the period. Dealer financing costs also moved higher in the most recent week, reflecting both the pressures in the funds market and larger dealer financing needs.

Prospective developments. On the assumption that net borrowed reserves will continue to average close to recent levels over the next 4 weeks, the 3-month bill rate might be expected to fluctuate in a 4.55 to 4.70 per cent range. The recent tightening of money market conditions may persist through the April tax period, when Federal funds are likely to continue trading at 4-3/4 per cent and occasionally at 4-7/8 per cent. Such pressures could abate toward the end of April and in early May. After the mid-April tax date funds typically shift toward the money centers. Also, seasonal demands for bills, from public funds and other investors, may be supplemented by demand from sellers of maturing issues in the Treasury May refunding. But rather heavy agency issues in prospect for the weeks ahead, including a sizable amount of new money, could be an offsetting influence.

The course of bond yields will be importantly influenced by Administration policy with respect to a tax increase. So long as economic indicators remain buoyant, continued postponement of a decision on taxes could generate a new wave of bearish investor sentiment. The Government bond market is now particularly susceptible since it is in a less strong technical condition as a result of the recent build-up in dealer bond positions.

The downward movements of bond and bill yields since early March have occurred despite some tightening of bank net reserve positions. As noted above, continuation of the present reserve posture is not likely to be accompanied by any further decline in rates and probably by some upward movement. Any further tightening of reserves -- to, for example, net borrowed reserves in a \$250-\$300 million range -- is likely to place bill rates in a 4.60-4.75 per cent range and at the same time exert further upward pressure on bond yields, particularly if market participants become convinced that a further step-up in monetary restraint is in process.

Reserve flows, bank credit, and money

Recent developments. Increases in total deposits and total reserves were slightly stronger in the second half of March than anticipated at midmonth, with the daily average figures for the month as a whole now showing annual rates of increase of 3 per cent in both cases over the previous month. Higher member bank

borrowing accounted for all of the increase in total reserves, as nonborrowed reserves declined for the first time since last September.

Weekly data indicate a sharp bulge in deposits and credit over the March tax period and into early April, following the sluggish growth of the previous four weeks. Much of this increase appears temporary. The more rapid expansion of time deposits in recent weeks apparently reflects city bank attempts to prepare for expected large credit demands later in April and to lengthen average maturities on CD's. In addition, dealer borrowing from banks increased substantially during the last two statement weeks in reflection of their enlarged inventories.

Prospective developments. With increases in all categories of deposits pushing levels well above the March average in the latest weeks and with credit demands remaining very strong through the April 15 tax period, a sharp rise is expected in the daily average bank credit proxy this month, with the annual rate of increase in the 10-12 per cent range. An increase in total reserves of about 7 or 8 per cent would appear consistent with this expected expansion.

After April, a more moderate rate of increase in monetary aggregates is anticipated, even if net borrowed reserves are not deepened from recent levels. The rate of increase in bank credit may fall back to or somewhat below the projected March-April average

of around 7 per cent. Several factors may reduce time deposit expansion below the rate of recent weeks -- the spread between CD and bill rates may narrow, and both growing corporate spending programs and prospective large agency offerings may absorb funds that would otherwise be invested in CD's. Bank credit growth is also likely to be moderated by repayments of the enlarged borrowing during the March 15-April 15 tax period. On the other hand, the mid-May Treasury refunding may temporarily increase bank credit expansion, though the effect may be relatively small in view of the expected routine nature of the financing.

Moderation of loan demand after mid-April would also tend to reduce the growth rate of private demand deposits to around 5 per cent over the months ahead. The rate of increase in April may still average above that rate, although below the March average of 12 per cent.

1/ For retrospective details, see Table B-4.

p - Preliminary.

2/ For factors included, see Table B-3.

3/ For required reserves by type of deposits, see Table B-2.

4/ See reverse side for explanation of projections.

Explanation of Projections in Table B-1

1. Changes in Federal Reserve credit inciate reserves needed to offset projected changes in required reserves and factors affecting the supply of reserves.
2. Projected changes in currency outside banks reflect seasonal movements plus an allowance for growth of about \$30 million per week.
3. Projected effects of Treasury operations, included in "technical factors," reflect scheduled and assumed calls in current two weeks and thereafter, maintenance of Treasury balances with Federal Reserve at \$200 million.
4. Projected changes in gold stock reflect assumed outflow after April at the rate of about \$50 million per month.
5. Projected changes in required reserves reflect estimated seasonal movements in private deposits, except as indicated in projections in Table B-2, and projected movements in U. S. Government demand deposits. Government deposit projections are based on anticipated Treasury receipts and expenditures and the following assumed financing operations: none.
