

Prefatory Note

The attached document represents the most complete and accurate version available based on original copies culled from the files of the FOMC Secretariat at the Board of Governors of the Federal Reserve System. This electronic document was created through a comprehensive digitization process which included identifying the best-preserved paper copies, scanning those copies,¹ and then making the scanned versions text-searchable.² Though a stringent quality assurance process was employed, some imperfections may remain.

Please note that some material may have been redacted from this document if that material was received on a confidential basis. Redacted material is indicated by occasional gaps in the text or by gray boxes around non-text content. All redacted passages are exempt from disclosure under applicable provisions of the Freedom of Information Act.

¹ In some cases, original copies needed to be photocopied before being scanned into electronic format. All scanned images were deskewed (to remove the effects of printer- and scanner-introduced tilting) and lightly cleaned (to remove dark spots caused by staple holes, hole punches, and other blemishes caused after initial printing).

² A two-step process was used. An advanced optical character recognition computer program (OCR) first created electronic text from the document image. Where the OCR results were inconclusive, staff checked and corrected the text as necessary. Please note that the numbers and text in charts and tables were not reliably recognized by the OCR process and were not checked or corrected by staff.

MONEY MARKET AND RESERVE RELATIONSHIPSMoney markets

Recent developments. Interest rates on a variety of short-term debt instruments have moved higher in recent weeks, and the money market has displayed a generally tight atmosphere. Federal funds have traded mainly at 4-3/4 per cent, but with an increasing amount of trading at higher rates, including trading most recently at 5 per cent and a few reported transactions at 5-1/8 per cent. With a tight funds market, dealer financing costs have moved into a higher range. Since mid-April the 3-month bill rate has held close to 4.65 per cent after rising around 15 basis points earlier in the month. Because of high financing costs, dealers have not been very willing holders of bills recently; still, demand for bills from the public and the System has remained fairly large, although there was some disappointment about the extent of bill demand associated with the refunding.

The recently tighter atmosphere of money markets has reflected in part the increased pressure on bank net reserve positions. Over the four statement weeks ending May 4, net borrowed reserves averaged about \$270 million and member bank borrowings about \$635 million--compared with averages of \$225 million and \$565 million, respectively, in the previous 4 weeks. Member bank borrowings averaged above \$600 million in every week since late March.

^{2/} Time deposits, adjusted, at all commercial banks differs from time deposit required reserve series in table A-2 since latter includes only member banks.

p - Preliminary

May 6, 1966.

Prospective developments. On the assumption that net borrowed reserves will continue to average \$250-\$300 million over the next 4 weeks, the 3-month bill rate is likely to fluctuate mainly within a 4.60 to 4.75 per cent range. Departures from this range on some days are quite possible, however, as strong cross-currents will be at work in the bill market. Among the factors tending to lower rates will be a seasonal tendency toward decline, particularly with the maturity of \$4.5 billion of tax bills in mid-June. Some demand for bills also could be generated over the near-term from temporary investment of the cash proceeds of Treasury issues not exchanged in the current refunding (in which the attrition rate was above 40 per cent even after sizable Treasury purchases of when-issued securities before books were closed). In addition, demand for short Governments stemming from reinvestment of proceeds from security flotations is likely to continue. Any renewed weakness in the stock market also could generate some downward pressure on bill rates.

Among the factors which will tend to exert a tightening influence on rates will be continuing pressure from dealer financing costs associated with a taut Federal funds market. While dealers have reduced their bill inventories somewhat recently, these remain well above the low levels of late winter and any efforts by dealers to work current inventories lower would tend to be reflected in higher rates. Prospects of a large supply of Federal agency issues

in the weeks ahead are also likely to exert upward pressure on bill rates, as will continued aggressive bank efforts to attract CD funds especially in preparation for the June dividend and tax dates. Finally, the System will return to the selling side of the bill market around mid-May, although its sales to absorb reserves are not expected to be as large as its recent purchases.

Some deepening of net borrowed reserves in the period ahead may have been already discounted by the market, but a substantial decline to, say, around \$400 million, probably would have a significant psychological impact. The reserve pressure itself will have a substantial effect on already high day-to-day financing costs. And the 3-month bill rate would likely under the circumstances rise to a range above 4.75 per cent.

Market uncertainties, as reflected in recent gyrations of common stock prices, make the outlook for bond yields more cloudy than usual. In the absence of further expectational shocks, however, bond yields are likely to drift higher in the weeks ahead even if net borrowed reserves are little changed from current levels. Contributing factors will be the continuing large corporate and municipal calendar and the likelihood of some agency financing in the intermediate-term area. A substantial further tightening of bank reserve positions would accelerate such a rise in bond yields.

A 3-month bill fluctuating above 4-3/4 per cent would certainly result in active market discussion about the sustainability of the existing time deposit ceiling rate and of the discount rate. The discount rate would appear to be the more immediately vulnerable as bill rates rise; banks will become increasingly desirous of borrowing as they find their reserve positions under pressure and Federal funds trading more frequently at a large premium above the discount rate.

Reserve flows, bank credit, and money

Recent developments. In April both private demand and time deposits showed their largest increases in several months and U. S. Government deposits rose moderately. Thus, total member bank deposits (credit proxy) increased sharply in April. With all types of deposits increasing, required reserves increased at nearly a 15 per cent annual rate in April, and total reserves rose somewhat more as some banks added to their excess reserves after the low March level. The System supplied the bulk of the increase in reserves, with nonborrowed reserves rising at about a 13 per cent annual rate, but banks were also forced to increase their borrowings at the Federal Reserve.

Since around mid-April outstanding private demand deposits and the total money supply have declined slightly. Growth in bank credit (as measured by the proxy) has continued, but at a pace

slightly slower than from mid-March to mid-April. U.S. Government deposits have grown sharply over the past two weeks, contributing in part to the slowing of money expansion. Meanwhile, total time and savings deposits have continued to increase, but the very latest data suggest that the sharp spurt in the latter part of March and April may be tapering off.

Prospective developments. Assuming no change in net borrowed reserves from recent levels and continued strength in loan demands from businesses and financial institutions, the principal potential factors affecting variations in the growth of bank credit and deposits between now and midyear include the following: (1) repayments of loans made by banks related to the March-April tax period and sales of liquid assets that banks accumulated over that period; (2) the rise in U.S. Government deposits, associated in part with issues of agency debt; (3) pressures developing around the June dividend and tax periods; and (4) more moderate growth in time deposits.

Considering these factors, it appears likely that bank credit growth may average around 8 per cent between now and midyear, with the rate of growth tending to be moderate in May and larger in June. In the weeks immediately ahead, expected repayments of security loans, together with bill sales by dealer banks, will tend to reduce bank credit growth. And these factors, together with a

continued rise in U.S. Government deposits, may lead to a decline in outstanding private demand deposits and the money supply.

As spring progresses, further pressures for credit expansion are likely to develop as a result of sizable Federal agency issues (which could total \$2 or \$3 billion for new cash--although this is more than usually subject to a number of uncertainties) and June speed-ups of corporate income tax payments and corporate remittances to the Treasury of individual income tax withholdings.

Private demand deposit growth may be resumed later in the spring. Over the next two months, on balance, such deposits may show little change, which would bring the annual rate of increase over the first half of 1966 to around 4.5 per cent. It is not expected that banks' time deposits will expand as rapidly over the next few months as they did in April. As the initial impact of higher rates on savings certificates passes, gains should be more moderate. And while we do not have current information on CD maturities, it appears likely that banks may find it more difficult to replace maturing issues in view of the competition from other short-term paper.

1/ For retrospective details, see Table B-4.

p - Preliminary.

2/ For factors included, see Table B-3.

3/ For required reserves by type of deposits, see Table B-2.

4/ See reverse side for explanation of projections.

Explanation of Projections in Table B-1

1. Changes in Federal Reserve credit inciate reserves needed to offset projected changes in required reserves and factors affecting the supply of reserves.
2. Projected changes in currency outside banks reflect seasonal movements plus an allowance for growth of about \$30 million per week.
3. Projected effects of Treasury operations, included in "technical factors," reflect scheduled and assumed calls in current two weeks and thereafter, maintenance of Treasury balances with Federal Reserve at \$200 million.
4. Projected changes in gold stock reflect assumed outflow after May at the rate of about \$50 million per month.
5. Projected changes in required reserves reflect estimated seasonal movements in private deposits, except as indicated in projections in Table B-2, and projected movements in U. S. Government demand deposits. Government deposit projections are based on anticipated Treasury receipts and expenditures and the following assumed financing operations: \$-0.5 billion, May, 16;(attrition); \$0.4 billion, May 23; \$0.2 billion, May 25.
