

## **Prefatory Note**

The attached document represents the most complete and accurate version available based on original copies culled from the files of the FOMC Secretariat at the Board of Governors of the Federal Reserve System. This electronic document was created through a comprehensive digitization process which included identifying the best-preserved paper copies, scanning those copies,<sup>1</sup> and then making the scanned versions text-searchable.<sup>2</sup> Though a stringent quality assurance process was employed, some imperfections may remain.

Please note that some material may have been redacted from this document if that material was received on a confidential basis. Redacted material is indicated by occasional gaps in the text or by gray boxes around non-text content. All redacted passages are exempt from disclosure under applicable provisions of the Freedom of Information Act.

---

<sup>1</sup> In some cases, original copies needed to be photocopied before being scanned into electronic format. All scanned images were deskewed (to remove the effects of printer- and scanner-introduced tilting) and lightly cleaned (to remove dark spots caused by staple holes, hole punches, and other blemishes caused after initial printing).

<sup>2</sup> A two-step process was used. An advanced optical character recognition computer program (OCR) first created electronic text from the document image. Where the OCR results were inconclusive, staff checked and corrected the text as necessary. Please note that the numbers and text in charts and tables were not reliably recognized by the OCR process and were not checked or corrected by staff.

## MONEY MARKET AND RESERVE RELATIONSHIPS

Money markets

Recent developments. Bill rates moved even further out of touch with other short-term rates during recent weeks. The 3-month bill declined below the discount rate and was quoted as low as 4.34 per cent during the past few days, before turning up on Friday. Rates on short-term Federal Agency issues have also edged down to levels slightly below their early June peaks, as the market has digested the recent influx of new issues.

Other short-term rates, however, have remained stable or advanced slightly further. This week major New York banks have posted a  $5\frac{1}{2}$  per cent rate on 3-month CD's, and there are reports of prime banks willing to pay that rate on one-month maturities. Federal funds have traded at  $5\frac{1}{2}$  per cent in the last few days and even touched  $5\text{-}5/8$  per cent, in the backwash of loan demand related to accelerated tax payments; and dealer loan rates rose further to a new high of  $5\text{-}7/8$  per cent in New York.

Net borrowed reserves after revision averaged about \$325 million over the two statement weeks ending June 15, somewhat below their May average, but rose to \$417 million in the latest statement week. Member bank borrowings were relatively low by recent standards in the week ending June 8--the second half of a country bank settlement period--but increased to an average of \$740 million during the past two statement weeks.

FINANCIAL MARKET RELATIONSHIPS IN PERSPECTIVE

<sup>1/</sup> Time deposits adjusted at all commercial banks.

<sup>2/</sup> June averages of free reserves and borrowings are for the four weeks ending June 22; money market rates and bond yields are averages for the month to date; and changes in monetary variables include projections for the final week of June.

<sup>3/</sup> Base is average for month preceding specified period or in the case of weekly periods, the first week shown.

p - Preliminary. \*\*Not representative. \*Changes have been adjusted for redefinition of time deposits effective June 9.

June 24, 1966.

The gathering tightness in the banking system as the period progressed tended to focus on major banks in New York, whose basic reserve deficiency (net borrowed reserves plus net Federal funds purchases) worsened sharply in the latest statement week. This worsening was larger than normally occurs in the first few days after the mid-June tax date and was related in part to the continued loan demand to help corporations make accelerated payments to the Treasury of withheld individual income and social security taxes.

Prospective developments. Assuming net borrowed reserves over the next four weeks remain around the \$370 million average of the past two statement weeks, one might expect some shifting of relationships within the constellation of money market conditions but continued market tightness over-all. Treasury bill rates may continue low in the period immediately ahead in view of the extremely short market supply of bills and of the System's need to supply about \$1 billion of reserves over the July 4 holiday period. Subsequently, bill rates are likely to rise, and perhaps rapidly. Banks will be reversing window-dressing operations, investor demand for bills may be reduced as the volume of new capital market issues tapers off in early summer, and high financing costs will begin to bite as dealer bill positions rise. A most important factor in the bill market, however, will be the Treasury's decision with respect to the size and timing of any tax bill financing.

Once the current tax-related burst of loan demand at banks passes, there may be some easing in the Federal funds rate. Dealer loan rates would also tend to decline somewhat, but should remain on

the high side so long as basic loan demands are strong and banks encounter difficulties finding CD funds.

The relatively light July calendar for corporate and municipal issues suggests that credit demands will not place much upward pressure on long-term rates over the next four weeks, although shifting expectations could lead to some rate rise. Moreover, it is possible that recent declines in yields on Treasury notes and bonds may be at least partially reversed in response to investor switching into attractively priced Agency, municipal, and corporate issues and to possible selling by financial institutions under liquidity pressure.

The extent of savings outflows from nonbank savings institutions after midyear and the likely responses of the institutions themselves and of the regulatory authorities are among market uncertainties that will be resolved soon. If such savings outflows are sizable and if the Federal Reserve provides assistance to the institutions involved one way or another through the discount function, both market expectations and open market operations might be affected in the short-run.

To the extent that any such Federal Reserve lending is allowed outside the conventional Regulation A constraints, the System may need to make substantially offsetting open market sales of securities in order to guard against an incidental easing of credit conditions, at least over the short-run, in the process of providing assistance through the discount window to a particular sector of the market. However, it is difficult to foresee the net outcome of so complex a situation--

coming as it would amidst all the already existing uncertainties as to Vietnam, fiscal policy, and monetary policy actions. One possibility is that resulting shifts in market expectations could lead to upward interest rate movements. Such expectations could also be generated by more widespread announcements of increases in rates paid by nonbank savings institutions.

In so potentially fluid a situation, compounded by a combination of changing financial asset preferences and public policies, money market conditions may need to be given more than the usual degree of emphasis in the conduct of open market operations. Under the circumstances, an effort to achieve somewhat deeper net borrowed reserves (say to persistently around \$450 million), apart from any special Federal Reserve lending outside ordinary Regulation A constraints, would have to be undertaken cautiously. Such a net borrowed reserve level would intensify upward pressure on interest rates. But the degree of pressure would depend on whether this was interpreted as just one further step toward an even deeper net borrowed number and on whether or not the market expected Regulation Q ceilings and the discount rate to be raised.

Reserve flows, bank credit, and money

Recent developments. On the basis of estimates for the first three weeks in June, expansion in bank credit on average for all of the month probably will be at about a 5 per cent rate, slightly less than anticipated at the beginning of the month. Credit expansion

was slow in the first half, but picked up sharply on and after the mid-month tax date. As a result, the bank credit increase measured from the beginning to the end of June is likely to be about 13 per cent.

Private demand deposits are likely to expand at a 15 per cent annual rate for June, although the impact of new tax speed-ups makes it more than usually difficult to estimate both private and Government demand deposits for the last two weeks of the month. The estimated rapid expansion in private demand deposits this month is being offset in part by a larger than anticipated decline in Government demand deposits, seasonally adjusted. Time and savings deposits in June appear to be growing at a slower rate than in May.

These June estimates imply expansion rates for the first half of 1966 as a whole somewhat below those for the year 1965 for bank credit, time deposits, and nonborrowed reserves. The credit proxy has increased at an annual rate of 7 per cent thus far this year, compared with 9 per cent in 1965; nonborrowed reserves have increased at about 2.5 per cent this year, compared with 4.2 last year; and time deposits have grown by 9.5 per cent compared to 16 per cent last year. On the other hand, money supply and total reserves have increased almost as rapidly as last year--4.7 and 5 per cent respectively.

Prospective developments. The rapid increase of bank credit over the latter part of June may slow down as July progresses, but the average increase in July is likely to be relatively large--perhaps in the order of 9-11 per cent. The large increase in July reflects in part

the delayed impact on the monthly averages of the late June rise. But also during next month further acceleration of corporate payments to the Treasury of withheld individual income and social security taxes may add to basically strong business loan demands. Furthermore, any substantial borrowing at banks by nonbank financial institutions to meet concentrated savings withdrawals would serve to enlarge bank credit totals. The current projection also does not assume a Treasury cash financing in July but if there is one, it is likely to be more toward the end of the month and therefore would have only a comparatively small effect on the average credit expansion.

Several factors make the outlook for time deposit growth particularly uncertain in the weeks ahead. Perhaps the principal unknown is how banks will fare after the midyear interest-crediting date when an outflow of funds from nonbank savings institutions is widely anticipated. Recent announced rate increases by nonbank savings institutions may tend to restrain growth in consumer-type time deposits at banks. With respect to negotiable CD's, the availability of funds for investment in them has probably been limited recently by corporate needs to make accelerated tax payments of one sort or another and by competition from Federal agency issues. Still, at the current level of market rates-- and with the bulk of the recent agency issues absorbed into the market-- banks may find that they can increase outstanding CD's some in the period ahead. Over-all, time and savings deposits may rise at a pace perhaps no more rapid than the 8-10 per cent annual rate of the past two months and perhaps by less.

On our current projections Government deposits are expected to decline less than seasonally in July, even assuming no Treasury cash financing. This may hold down the growth of private demand deposits (and money supply) over the short-run. Over the longer run, there is little reason to expect any significantly lower rate of growth in money than the 4.7 per cent rate of the first half of this year, assuming no let-up in basic loan demands. This outlook adds up to an annual rate of expansion for total required reserves, seasonally adjusted, in the order of 10 per cent during July on average.

p - Preliminary.

### Explanation of Projections in Table B-1

1. Changes in Federal Reserve credit indicate reserves needed to offset projected changes in required reserves and factors affecting the supply of reserves.
2. Projected changes in currency outside banks reflect seasonal movements plus an allowance for growth of about \$30 million per week.
3. Projected effects of Treasury operations, included in "technical factors," reflect scheduled and assumed calls in current two weeks and thereafter, maintenance of Treasury balances with Federal Reserve at \$600 million.
4. Projected changes in gold stock reflect assumed outflow after July at the rate of about \$50 million per month.
5. Projected changes in required reserves reflect estimated seasonal movements in private deposits, except as indicated in projections in Table B-2, and projected movements in U. S. Government demand deposits. Government deposit projections are based on anticipated Treasury receipts and expenditures and the following assumed financing operations: June 24, \$0.4 billion; July 29, \$0.6 billion; August 1, \$-0.8 billion.
