# MONETARY AGGREGATES AND MONEY MARKET CONDITIONS 

Prepared for the Federal Open Market Committee

[^1]MONETARY AGGREGATES AND
MONEY MARKET CONDITIONS
Recent developments
(1) Rates of expansion of $M-1 A$ and $M-1 B$ were relatively rapid in October, though below rates of the previous two months. Growth in M-2 and M-3 accelerated slightly as inflows of time deposits at banks and thrifts strengthened and withdrawals from money maricet mutual funds slowed. The recent growth of M-1A-minich was well above the Committee's target path for the last three months of the year-oputs it within one-half percentage point of the upper end of its long-run range for the year, while growth rates of the other aggregates are now almost one percentage point above longer-run upper limits (if the case of $M-1 B$ and $M-2$ ) or equal to the upper limit (in the case of $\mathrm{M}-3$ ). Though business lending continued to expand rapidly, growth of bank credit decifned somewhat from the September rate and the year-to-date growth in this aggregate remains in the lower half of its longer-rum range.

#### Abstract

(2) Total reserve growth moderated in October, reflecting a slowing of demand deposits. Nevertheless, over the intarmeeting period required reserves outran the System's provision of nonborrowed reserves, leadigg to incseasiag member banis borsowings and firmigg coaditions in the finds mariset. If In the most recent statement meeik, boriowings raached. a level of about $\$ 2$ billion, somewhat higher than expected (a $\$ 1.6$ billiot Level of borrowing had bean frplied by the nonborrowed path). The faderal funds rate rose from around $12 \frac{1}{2}$ percent in midoOctober to ar average of $14-5 / 8$ percent in the most recent full statement week. In recenc days, furds have traded around 14 percent.

| :--- | :---: | :---: |
| Special borrowtugs | 90 | 0 |

* Special borrowings include emargency credit as well as a large borrowing by one bank in the week ended September 24 that resulted from a breakdowr of computer facilities.

I/ See Appendix I for the reserve paths and adjustments for the intermeeting period.
(3) Since the last meeting, short-term interest rates have risen about $1 \frac{3}{4}$ to $2 \frac{1}{2}$ percentage points on balance, wilie bond yields incressed about $3 / 4$ of a percentage point. Monicipal bond yields have now returned to their all-time highs set last spring, and corporate and Treasury bond yields are also ciose to their earlier peaks. A one percentage point increase in the basic discount rata to 12 percent, and a surcharge of 2 percentage points applicable to large frequent borrowers of adjustment credit, were anounced after the markets closed on Friday.
(4) The Treasury continued to be a large borrower in the intermeeting period, raising about $\$ 5 \frac{3}{2}$ billion in cash through bills and another $\$ 4 \frac{7}{4}$ billion through coupon issues. Short-term credit demands of business remained strong as rate relationships contined to induce shifting of business credit demands from the capital mariket. Such demands contimed to be focussed on commercial banks, with commercial paper run-offs accelerating in response to aggressive bank Loan pricing, Reflecting both rising bond rates and the increasing cost of deposit funds, the average commitment rate on conventional mortgages at S\&I's rose by 30 basis points over the intermeeting period to 14.08 percant; even at that rate the spread of the mortgage rate over the corporate bond rate remained narrow by historical standards. In some areas of the country mortgage rates of 15 to 16 percent have been posted.
(5) Reflecting the further increase in D.S. interest rates, while rates abroad were essentially unchanged, the weighted average foreign exchange value of the dollar has risen by more than 2 percent, on balance, since the last FOMC meeting.

## -4-

\$13 billion, nearly all against DM, as the System and the Treasury accumulated balances, with the latter seeking to cover its Carter bond obligations.
(6) The table on the next page shows seasonally adjusted annual rates of change, in percent, for selected monetary and financial flows over various time periods.

NOTE: The following annual rates of growth in bank credit for the year and for the quarters are expected under alternative B: year 1980, 7; QI, 92 ; QII, - $\frac{1}{2}$; QIII, $6 \frac{1}{4}$; QIV, 11年. Only minor variations in growth rates would be expected under alternatives $A$ and $C$.
end of their respective longer-rum ranges. Growth of M-1A would be somewhat above the midpoint of its longer-run range. However, as nay be seen in the charts following this page, the alternatives have different implications for the level of the aggregates relative to growth cones by year-end, particularly for the narrow aggregates. Moreover, the choice among these policy options could have a significant effect on inflationary expectations and real economic activity over the months ahead, and thus on the pattern of economic and financial developments associated with achieving next year's monetary targets.
(9) Alternative $B$ continues the Committee's current targets for the fourth quarter, as indexed by $M-1 A$ and $M-1 B$. Given what has already occurred in October, to achieve these targets M-1A would have to contract over the remaining weeks of the year. The staff still believes that a significant slowing in the growth of transactions balances is likely, partly because of the sharp rmop in interest rates of the last three months and partly on the assumption that the recent very rapid month-to-month growth in economic activity slows significantly. However, achieving the negative growth in M-1A over the balance of the year implied by alternative $B$ would probably require further near-term increases in shert-term interest rates.
(10) To achieve the specifications of alternative B, total reserves would have to increase at about a 6 percent amual rate over the October to December period. I/ Nonborrowed reserves would have to contract by about a 1 percent ammal rate if the level of adjustment borrowing is around

1/ About 4 percentage points of this increase reflect the additional required reserves associated with the substantial reduction of weekend Eurodollar arbitrage.activities.

Actual and Targeted M-1A and $\mathbf{M - 1 B}$

Actual and Targeted M-2 and M-3

* Note: A, B, and C al ternatives are indistinguishable on this scale.
\$1른 billion and by more if the level of borrowing rises further. However, the exact setting on the nonborrowed reserve operating path will depend in part on bank responses to the new discount rate structure. If past experience with the surcharge is any guide, banks are likely to become less willing borrowers, thereby reducing the level of borrowing for any given spread of the funds rate over the basic discount rate. However, earlier experience with the surcharge was within the context of a bank credit restraint program, and bank behavior may differ under current circumstances. Thus, there is more than usual uncertainty about the demand for borrowing, and therefore about the level of the nonborrowed reserve path consistent with money supply and total reserve targets of alternative 3 .
(11) Juder alternative B, a funds rate in the 15 to 16 percent range is likely to emerge over the weeks inmediately ahead, and possibly higher before the gear is out. The 3-month bill rate may move up into a 14 to 15 percent range and the 3 -month $C D$ rate about a point higher, reflecting in part contimed relatively strong demands on short-term credit markets over the balance of the gear. The Treasury is expected to raise about $\$ 4 \frac{1}{2}$ billion in cash in the bill market and $\$ 7.5$ billion in coupon offerings of 2, 4, and 5 years. Business credit demands may fall most heavily or short-teril maricets, especially if, as seems likely, long-term rates rise further under this alternative, inducing added restraint on corporate bond offerings. Finally, continued intervention by the U.S. to slow the appreciation in the foreign exchange value of the dollar-mhich is likely to continue rising under alternative B-could generate additional pressure on Treasury gields as the Federal Reserve or Treasury offers securities to the market to finance foreign currency purchases.
(12) The further increase in incerest rates under alternative

3 would intensify pressures on mortgage markets and thrift institutions. Deposit flows are projected to decelerate, but to remain relatively ample. Nonetheless, mortgage sates would be expected to rise considerabiy in seflection of the increases in the cost of deposit funds and yields on altermative assets. With mortgage rates already at levels that have begun to choke off demand, new commitment activity for longer-term residential mortgages at thrift instituthons would probably become quite depressed.
(13) The further rise in interest rates under alternative B--the underlying assumption for the Greenbook projection-ois an element in the staff's anticipation that real GNP will decifine in early 1981. The dampening of the transactions demand for money in lagged response to the rumap in interest sates and to the projected weakening in economic activity suggest that interest rates could temporarily ease in early 1981, assuming 1981 monatary targets as reportad to the Congress in July. I/ However, for all of nent year, the effects of inflation on the transactions demand for money are expected to require historically high intereat rates in order to restrain growth in the monetary aggregates to the preliminary FOMC targets.
(14) Alternative A encompasses somewhat higher money targets for the fourth quarter than altermative B--targets that are thought to be achievable with little change in interest rates from enrrent levels. Assuming a Level of member bank borrowing of around $\$ 1 \frac{1}{2}$ billion, nonborrowed and total reserves under this alterastive would be expected to incresse at amol rates of 4 and 7 percent, respectively, over the October to December period, and the federal funds rate may be around the 14 to 15 percent area. Other market interest rates also would be expected to remain at about their current levels. However, some short-term rates might adjust up slightly
I) See Appendix II for the projected quarterly pattern of interest rates under alternative B.

Eurther due to the strength in short-term credit demands and, in the case of the prime and mortgage rates, to lagged adjustments to the tightening that has already occurred. With interest rates lower over the balance of the jear than under alternative $B$, money growth and economic activity would be expected to be less weak in early 1981.
(15) Alternative C contemplates a reduction in the Committee's current fourth quarter money growth target, and implies a substantial reduction in money growth over the balance of the year that brings the level of M-1B into the FOMC's target zone by December. To achieve the alternative C specifications would probably require a reduction in nonborrowed reserves at about a 5 percent annual rate over the last two months of the year, if a borrowing level of $\$ 2$ billion, or a bit higher, is assumed. The funds rate may move up to around the 16 to 17 percent area over the next few weeks, and possibly higher by year-end. This alternative increases the risk of a more significant drop-off in money growth and economic activity in early 1981, and consequently increases the likelihood that interest rates will be lower in the first quarter of the gear than under the other two altematives. However, the staff would anticipate that, even under this altermative, interest rates over the next year would still have to be high by historical standards to constrain money growth to the Comittee's preliminary targets.

Directive language
(16) Given below are suggested operational paragraphs for the directive consistent with the form of the directive adopted at the October meeting. The language continues to call for expansion of reserve aggregates at a pace consistent with the desired rate of monetary growth over the last three months of the year, provided that the weekIy average federal funds rate remains within a specified range. The specifications adopted at the October meeting are shown in strike-through form.

In the short run, the Committee seeks behavior of reserve aggregates consistent with growth of $M-1 A, M-1 B$, and $M-2$ over the PRRIOD FROM September to December pertod at annual rates of about 2 $\frac{1}{2}$ ___ percent, 5 ___ percent, and $\boldsymbol{7} \frac{1}{4}$ ___ percent respectively, or-somewhet-iess? provided that in the period before the next regular meeting the weekly average federal funds rate remains within a range

If it appears during the period before the next meeting that the constraint on the federal funds rate is inconsistent with the objective for the expansion of reserves, the Manager for Domestic Operations is promptly to notify the Chairman, who will then decide whether the situation calls for supplementary instructions from the Committee.

## Interest Rates Consistent with the Greanbook GNP Forecast (percent)

|  | Federal funds | 3-month Treasury bil1 | $\begin{gathered} \text { New } \\ \text { Aaa-Ttilifty } \\ \text { Bomd } \\ \hline \end{gathered}$ | $\begin{aligned} & \text { Conventional } \\ & \text { Mortgage } \\ & \text { Commitment } \\ & \hline \end{aligned}$ |
| :---: | :---: | :---: | :---: | :---: |
| 1980--Q4 | $14 \frac{3}{2}$ | 133 | 133 | 14-3/8 |
| 1981--Q1 | $14 \frac{1}{2}$ | 13 | 1312 | 143 |
| Q2 | 14 | 123 | 13-3/8 | $14 \frac{1}{4}$ |
| Q3 | $14 \frac{1}{2}$ | 13t | 13-3/8 | $14 \frac{1}{2}$ |
| Q4 | $15 \frac{1}{2}$ | 14 | 1312 | 14-3/8 |

NOTE: These rate projections are based on the assumption that M-1A will grow 5 percent in 1980 (consistent with Bluebook alternative B), and $4 \frac{1}{4}$ percent in 1981 abstracting from the impact of nationwide NOW/ATS accounts. Such growth would fmply M-IA velocity increases in the two gears of 4 and $5 \frac{1}{4}$ percent, respectively. The Board's quarterly econometric model indicates that historical money demand relationships would require roughly $3 \frac{1}{2}$ percentage points greater growth of M-IA in 1981 to achieve the GNP and interest rates in the staff's judgmental Greenbook projection. Thus, these fnterest rate projections assume a further so-called downard shift in money demand as judged from the prediction error in the Board's model.

NOTE: Government security dealer trading positions are on a commitment basis. Trading positions, which exciude Treasury securities financed by repurchase agreements maturing in 16 days or more, are indicators of holdings available for sale over the near term, Underwriting syndicate positions consist of issues in syndicate, excluding trading positions. Weekly data are daily averages for statement weeks, except for corporate and municipal issues in syndicate, which are Friday figures.
** Strictly Confidential.
** Monthly averages for excess reserves and borrowing are weighted averages of statement week figures.

[^0]:    ${ }^{1}$ In some cases, original copies needed to be photocopied before being scanned into electronic format. All scanned images were deskewed (to remove the effects of printer- and scanner-introduced tilting) and lightly cleaned (to remove dark spots caused by staple holes, hole punches, and other blemishes caused after initial printing).
    ${ }^{2}$ A two-step process was used. An advanced optimal character recognition computer program (OCR) first created electronic text from the document image. Where the OCR results were inconclusive, staff checked and corrected the text as necessary. Please note that the numbers and text in charts and tables were not reliably recognized by the OCR process and were not checked or corrected by staff.

[^1]:    By the staff Board of Governors of the Federal Reserve System

[^2]:    I/ Total and nonborrowed reserves path adjusted upward by $\$ 170$ million on October 24, 1980 to account for changes in multiplier relationships.
    2/ Targets and projections adjusted to reflect the impact of the implementation of the MCA on reserve aggregares in the week ending November 19.
    3/ Total and nonborrowed reserves path adjusted upward by $\$ 400$ million on November 7, 1980 to account for changes in multiplier relationships. In addition, the nonborrowed reserves path was further adjusted downard by $\$ 100$ million because of the strength in total reserves.
    4/ Total and nonborrowed reserves paths adjusted upward by $\$ 25$ million to account for estimated impact on excess reserves of the implementation of MCA. In addition, the nonborrowed reserves path was adjusted downward by \$SO million to adjust for strength in rotal reserves.
